ABSTRACT

Adolescence Education is a major problem facing the world today. In order to understand the issues related to socio-cultural factors among adolescence education, various theoretical perspectives were utilized and strategies to overcome were identified. The study was conducted in Schools Bhopal Madhya Pradesh. The participants included adolescents, whose ages ranged from 12 to 15 years their parents and science teachers. A qualitative, explorative research design was employed. Data was gathered using questionnaire, semi-structured interviews and observations. The study found that understanding the meaning and importance of these topic is mere theoretical mostly because students deal with it as a part of syllabus than learning about their health. The other factors for this include family structure, parenting, lack of proper communication and peer group influence. This study emphasizes the lack of proper knowledge of adolescence education among adolescents, yet at the same time it succeeds in highlighting the strategies that can be employed to address the issue. In addition, this study recommends a concerted effort by all the stakeholders in addressing the socio-cultural factors affecting the adolescence education problem.
